transplant (ASCT)?

Recovering from a stem cell transplant
Therapy Stem Cell Transplantation
Stem cell transplants are used to treat
conditions in which the bone marrow is
damaged and is no longer able to produce
healthy blood cells. Transplants can also
be carried out to replace blood cells that
are damaged or destroyed as a result of
intensive cancer treatment. Conditions
that stem cell transplants can be used to
treat include:

NHS

A stem cell transplant can take a few months to complete. The process begins with treatment of high doses of chemotherapy, radiation therapy, or a combination of the two. This treatment goes on for a week or two. Once you have finished, you will have a few days to rest. Next, you will receive the blood-forming stem cells. The stem cells will be given to you through an IV catheter.

Stem Cell Transplants in Cancer Treatment - National ...

A stem cell transplant uses stem cells from your bloodstream, or a donor ' s bloodstream. This is also called a peripheral blood stem cell transplant. A bone marrow transplant uses stem cells from your bone marrow, or a donor ' s bone marrow. Stem cell transplants are the most common type of transplant. Bone

transplant? | Stem cell...

The most studied type of stem cell therapy for MS is autologous haematopoietic stem cell transplantation (often shortened to AHST, ASCT or HSCT). This uses your own stem cells, which are collected and then injected back into your body. Early results have been encouraging and understanding how best to treat people with stem cells is improving.

Stem cell therapy | MS Trust

Stem cell transplantation, as a new treatment strategy, has been reported to improve cardiac function in patients with advanced HF after MI [6,7,8]. Stem cell transplantation can enhance tissue perfusion, contribute to angiogenesis, and preserve or regenerate myocardial tissue,

However, there is still no consensus about haematopoietic stem cell transplantation (HSCT) in the management of PNH; it is the only potentially curative therapy for PNH. There are limited data and few case series about both the long-term outcomes of HSCT for PNH and the impacts of conditioning regimens on PNH clones.

~~Is Allogeneic Stem Cell Transplantation a Good Option for ...~~

You have a stem cell transplant after very high doses of chemotherapy, usually melphalan. The chemotherapy has a good chance of killing the myeloma cells but it also kills the healthy stem cells in your bone marrow. Before your high dose

therapy, cell transplantation, or cytotherapy) is a therapy in which viable cells are injected, grafted or implanted into a patient in order to effectuate a medicinal effect, for example, by transplanting T-cells capable of fighting cancer cells via cell-mediated immunity in the course of immunotherapy, or grafting stem cells to regenerate diseased tissues.

~~Cell therapy - Wikipedia~~

Hematopoietic stem-cell transplantation (HSCT) is the transplantation of multipotent hematopoietic stem cells, usually derived from bone marrow, peripheral blood, or umbilical cord blood. It may be autologous (the patient's own stem cells are used), allogeneic (the stem cells come from a donor) or syngeneic (from an identical twin).

Wikipedia

Stem cell therapy and transplantation, also known as regenerative medicinal process of peripheral blood stem cell transplant, promotes the reparative response of diseased, dysfunctional or injured tissue using stem cells or their derivatives.

Journal of Stem Cell Therapy and
Transplantation | HSPG

Stem-cell therapy is the use of stem cells to treat or prevent a disease or condition. As of 2016, the only established therapy using stem cells is hematopoietic stem cell transplantation. This usually takes the form of a bone-marrow transplantation, but the cells can also be derived from umbilical cord blood. Research is underway to develop various sources for stem cells as well as to apply ...

Transplantation Types. Autologous Stem Cell Transplantation: In autologous stem cell transplantation, stem cells are donated by the patient and collected and frozen before the patient undergoes cancer treatment. After cancer treatment is given and the cancer cells are believed to be gone, the collected stem cells are reinfused back into the patient.

~~Stem Cell Transplantation – Lymphoma Research Foundation~~

A large number of clinical trials have shown stem cell therapy to be a promising therapeutic approach for the treatment of cardiovascular diseases. 'universal' E-CEL (human engineered cord endothelial) cells. The AB-205 cells are intravenously administered after the completion of HDT on the same day as when the patient's own (autologous) blood stem cells are infused.

~~Angiocrine Bioscience Announces FDA Regenerative Medicine ...~~

A stem cell transplant is used to restore normal blood cell production in people whose bone marrow has been damaged. A stem cell transplant (SCT) allows children to have much higher doses of chemotherapy than they could otherwise tolerate. This improves the chance of curing their cancer but has more side effects.
