diabetic foot surgical principles and practices

We get diabetic foot ulcers from pressure and shear forces. It will heal if we remove the pressure and shear forces. This is called offloading. Since foot ulcers are created by basically being squished between the ground/shoe and the bone, we can offload ulcers by removing the ground or removing the bone. Removing the ground means wearing some kind of device that is designed to take away pressure and/or shear.

Diabetic Foot: Surgical Principles And Practices ...

The most important initial step in treating soft tissue defects related to the diabetic foot is to perform a timely and complete surgical debridement. This entails the surgical excision of all non-viable and/or infected soft tissue and bone so that the wound margins and base of the soft tissue defect are healthy and viable.
