Surveillance, prevention and control of echinococcosis. The disease can be prevented by periodic deworming of dogs, improved hygiene in the slaughtering of livestock including proper destruction of infected offal, and public education campaigns. Vaccination of livestock with an E. granulosu s recombinant antigen (EG95) offers encouraging prospects for prevention and control.

~~WHO | Surveillance, prevention and control of echinococcosis~~

Echinococcosis/hydatidosis- surveillance, prevention and control: FAO/UNEP/WHO guidelines The need for the elaboration of strategies and methods for control of zoonoses and foodborne diseases was recognized by the Thirty-first World Health Assembly held in May 1978.

~~Echinococcosis/hydatidosis- surveillance, prevention and ...~~

Prevention programmes focus on deworming of dogs, which are the definitive hosts. In the case of cystic echinococcosis preventive measures also include, deworming dogs, slaughterhouse hygiene, and public education. More than 1 million people are affected with echinococcosis at any one time. Human echinococcosis is a zoonotic disease (a disease that is transmitted to humans from animals) that is caused by parasites, namely tapeworms of the genus Echinococcus.

~~Guidelines for surveillance, prevention and control of ...~~

Cystic echinococcosis is controlled by preventing transmission of the parasite. Prevention measures include limiting the areas where dogs are allowed and preventing animals from consuming meat infected with cysts. Prevent dogs from feeding on the carcasses of infected sheep. Control stray dog populations.

~~GDC- Echinococcosis- Prevention & Control~~

Human cystic echinococcosis (CE) has been eliminated or significantly reduced as a public health problem in several previously highly endemic regions. This has been achieved by the long-term application of prevention and control measures primarily targeted to deworming dogs, health education, meat i ...

Causal Agents. Human echinococcosis (hydatidosis, or hydatid disease) is caused by the larval stages of cestodes (tapeworms) of the genus *Echinococcus*. *Echinococcus granulosus* (sensu lato) causes cystic echinococcosis and is the form most frequently encountered. Another species, *E. multilocularis*, causes alveolar echinococcosis, and is becoming increasingly more common.

~~GDC—Echinococcosis—Biology~~

This chapter aims to describe the main methods recommended and employed to control cystic hydatidosis or cystic echinococcosis in control programs in several countries. The epidemiological surveillance applied to cystic echinococcosis is also reviewed because there is a significant relationship between surveillance and control, inasmuch as surveillance provides the baseline data necessary for any control program.

~~Control and Prevention of Hydatidosis | SpringerLink~~

Echinococcosis can be controlled through preventive measures that break the cycle between the definitive and the intermediate host. These measures include dosing dogs, inspecting meat and educating the public on the risk to humans and on avoiding feeding offal to dogs, as well as introducing legislation.

~~Review of echinococcosis/hydatidosis: a zoonotic parasitic ...~~

Cystic echinococcosis – hydatid disease. Surveillance for cystic echinococcosis in animals is challenging due to the fact that the infection is asymptomatic in livestock and dogs. Monitoring is also not recognized or focused on by communities or local veterinary services.

~~Echinococcosis: Symptoms, Causes, Treatment and Prevention~~

Prevention There are currently no effective drug treatments or vaccines to protect humans against the disease. Measures to prevent ingestion of the infective eggs and the infestation of dogs with the worm are key in stopping the spread of hydatid disease.
