So, elements can exist in the form of ions, atoms, isotopes, molecules. An example of an element is Nitrogen atom(N), Nitrogen gas (N_2), Nitrogen ion(N^{3-}) and Nitrogen isotopes (Nitrogen-13, Nitrogen-14, and Nitrogen-15).

An element is a material that consists of a single type of atom. Each atom type contains the same number of protons. Chemical bonds link elements together to form more complex molecules called compounds. A compound consists of two or more types of elements held together by covalent or ionic bonds.

Hydrogen, nitrogen, oxygen and chlorine are cheapest by volume at atmospheric pressure. When there is no public data on the element in its pure form, price of a compound is used, per mass of element contained. This implicitly puts the value of compounds' other constituents, and the cost of extraction of the element, at zero.

~~Elements and Compounds | Simplified for kids » Selftution~~

A chemical compound is a chemical substance composed of many identical molecules composed of atoms from more than one element held together by chemical bonds. There will be a fixed ratio for a chemical compound determining the composition of it. For example, water (H_2O) is a compound consisting of two hydrogen atoms bonded to an oxygen atom.
