~~Dental fluorosis and dental caries~~

What is Dental Fluorosis? Dental fluorosis is a common defect of tooth enamel caused by ingestion of too much fluoride during the first 8 years of life when enamel is formed( 1 ). Characterized by hypomineralization, the lack of calcium in teeth leads to visual changes in enamel, causing varying levels of discoloration and in some cases, damage to teeth.

Dental fluorosis is a common disorder, characterized by hypomineralization of tooth enamel caused by ingestion of excessive fluoride during enamel formation. It appears as a range of visual changes in enamel causing degrees of intrinsic tooth discoloration, and, in some cases, physical damage to the teeth. The severity of the condition is dependent on the dose, duration, and age of the individual during the exposure. The "very mild" form of fluorosis, is characterized by small, opaque, "paper wh

Fluorosis, also called dental fluorosis, is a condition that changes the appearance of tooth enamel in young children as a result of being exposed to too much fluoride. Children are only at risk for fluorosis while their permanent teeth are still forming. 1 □ Adults and children older than 8 do not get fluorosis.
