Initial genetic studies on Arabidopsis have identified many molecular components that either positively or negatively regulate competence to flower downstream of environmental and endogenous cues. Subsequently, further genetic studies together with genome-wide analyses have revealed the crosstalk between these regulators, illustrating the networks that are progressively increasing in ...

Molecular Basis of Inheritance. Genetics mainly deals with the study of genes, heredity, and genetic variation. Genes exist on chromosomes and chromosomes are comprised of DNA and proteins. DNA is a molecule that carries genetic information in all living organisms and viruses where it is used in reproduction, functioning, growth, and development. It is a long polymer of deoxyribonucleotides.

Molecular Basis of Inheritance - DNA, RNA and Genetic Code

Genetic analysis of solid tumours revealed the presence of a high degree of genetic abnormalities, such as aneuploidy, chromosome translocations etc. This is likely due to the lack of active p53 protein, and the ability of cancer cells to avoid cell death through apoptosis.

Reef-building corals are cnidarian animals (Anthozoa, Scleractinia) that mostly live in colonies composed of hundreds of thousands of tiny coral polyps. The polyps house dinoflagellate algal photosymbionts of the family Symbiodiniaceae inside their gastrodermal cells (Fig. 1 A), and this mutualistic association builds the three-dimensional structure of the reefs via deposition of calcium ...

Molecular genetics is a sub-field of biology that addresses how differences in the structures or expression of DNA molecules manifests as variation among organisms. Molecular genetics often applies an "investigative approach" to determine the structure and/or function of genes in an organism's genome using genetic screens.

The following examples show the known genetic and developmental basis of feather variations in domesticated chickens or pigeons . Although many domestication traits are caused by null coding mutations (Stern and Orgogozo 2009), the majority of feather phenotypic changes occurred through cis -regulatory changes in domesticated birds (table 1).
