Under such conditions, the distance  $z_2$  is equal to the focal length  $f$ . The equation becomes  $h^2 + u^2 = \frac{z_2^2}{f^2}$ . For  $z_1 = f$  and  $d = f$ , we have the object illuminated by a normally incident plane wave and situated in the front focal plane. Again  $z_2 = f$ .

Fourier optics is the study of classical optics using Fourier transforms, in which the waveform being considered is regarded as made up of a combination, or superposition, of plane waves. It has some parallels to the Huygens-Fresnel principle, in which the wavefront is regarded as being made up of a combination of spherical wavefronts whose sum is the wavefront being studied. A key difference is that Fourier optics considers the plane waves to be natural modes of the propagation medium, as ...
