 Time series is a sequence of data points in chronological sequence, most often gathered in regular intervals. Time series analysis can be applied to any variable that changes over time and generally speaking, usually data points that are closer together are more similar than those further apart. Introduction To Time Series. A time series is the continuous data points that have occurred at some point in time. This area in machine learning is often ignored. There are several key areas in the field of machine learning where time plays an important part in accordance to the data. so, As all the statistics data is concern the time series data is collected from the real life thing that we are interest in at the particular time.

Introduction to Time Series and Forecasting

Time series are used for: forecasting, estimating causal effects, estimating correlation over time. We'll define the following notations: The value of y at time t is given by y_t . The data points are: y_1, \dots, y_T . The first difference is given by: $\Delta y_t = y_t - y_{t-1}$.
