To deal with the large amount of aspects of aerodynamics of wind turbine rotors, the investigations started with the assessment of the stationary aerodynamic coefficients of the S809 airfoil. Next the effects of rotation were investigated after which the implementation within the BEM-based design codes (such as BLADMODE and PHATAS) were investigated.

In this study, both the blade and the wake aerodynamics of a straight-bladed VAWT are investigated using a three-dimensional computational fluid dynamics (CFD) model. The algebraic wall-modeled large eddy simulation (LES) was used for turbulence modeling.

The solidity ratio refers to the total blade area over the swept area of rotor blades, i.e., $\sigma = Nc/(\pi D)$, where N is the number of blades, c is the chord length, and D is the turbine diameter. McLaren and colleagues conducted a systematic investigation into the aerodynamic loading behavior of blades for a high-solidity three-bladed VAWT in a wind tunnel (McLaren, 2011 , McLaren et al., 2012).

□A dip in performance was observed for cases with rotors very close to each other at low Re . It was hypothesized that the interaction of rotor blades with the tip vortex cores of the neighboring rotor blades at small axis shifts could be a reason for the effect on efficiency. However, more focused tests are needed to confirm this.

The investigations show that it is strongly influenced by both the incoming wakes and the potential flow field of the downstream rotor blade row. If a disturbance arrives the leading edge or the trailing edge of the blade the pressure changes nearly simultaneously along the blade chord.

Preliminary aerodynamic analysis concluded NACA 63-425 to be the most efficient airfoil. Blade geometry was determined after calculating baseline geometric values for low drag which was then used to calculate power. Blade's structural integrity was studied using ANSYS® software. Tested results yielded that a single layer of E-fibreglass-epoxy

A blade vortex interaction is an unsteady phenomenon of three-dimensional nature, which occurs when a rotor blade passes within a close proximity of the shed tip vortices from a previous blade. The aerodynamic interactions represent an important topic of investigation in rotorcraft research field due to the adverse influence produced on rotor noise, particularly in low speed descending flight condition or
