ISO 5167-4:2003 specifies the geometry and method of use (installation and operating conditions) of Venturi tubes when they are inserted in a conduit running full to determine the flowrate of the fluid flowing in the conduit.

ISO - ISO 5167-4:2003 - Measurement of fluid flow by means ...

Part 4 of ISO 5167 covers three different manufacturing methods of classical Venturi tubes; as-cast, machined and fabricated. The general shape, Venturi profile, surface finish and bore requirements of Venturi for each of the three manufacturing methods are described in detail.

d) ISO 5167-4 specifies requirements for classical Venturi tubes 3. e) This part of ISO 5167 specifies requirements for cone meters and includes a section on calibration. Aspects of safety are not dealt with in ISO 5167 (all parts).

ISO 5167-5:2016(en), Measurement of fluid flow by means of ...

This part of ISO 5167 is not applicable to the measurement of pulsating flow. It does not cover the use of uncalibrated cone meters in pipes sized less than 50 mm or more than 500 mm, or where the pipe Reynolds numbers are below 8×10^4 or greater than $1,2 \times 10^7$. A cone meter is a primary device which consists of a cone-shaped restriction held concentrically in the centre of the pipe with the nose of the cone upstream.

In ISO 5167 there are three choices for the tappings: 1. Flange tappings. They are used more frequently because it is one of the simplest configurations and it is not necessary to drill the pipe. The high pressure outlet (H) is located 1 inch (25.4 mm) before the plate and the low pressure (L) 1 inch (25.4 mm) after the plate.

An orifice plate is a thin plate with a hole in it, which is usually placed in a pipe. When a fluid (whether liquid or gaseous) passes through the orifice, its pressure builds up slightly upstream of the orifice: 85–86 but as the fluid is forced to converge to pass through the hole, the velocity increases and the fluid pressure decreases. A little downstream of the orifice the flow reaches ...
