The Average Kinetic Energy of a gas particle can be calculated by using the following equation: $KE = \frac{1}{2}mv^2$, where. m = mass of the molecule (kg) v = speed of the molecule (m/s) KE is measured in joules. This formula doesn't have to be memorized for the most part, but it is good to understand.

Charles ' Law states that at constant pressure, the volume of a gas increases or decreases by the same factor as its temperature. This can be written as: $V_1 T_1 = V_2 T_2$ $V_1 T_1 = V_2 T_2$. According to Kinetic Molecular Theory, an increase in temperature will increase the average kinetic energy of the molecules.

Updated May 04, 2019. The kinetic theory of gases is a scientific model that explains the physical behavior of a gas as the motion of the molecular particles that compose the gas. In this model, the submicroscopic particles (atoms or molecules) that make up the gas are continually moving around in random motion, constantly colliding not only with each other but also with the sides of any container that the gas is within.
