They describe many different physical systems, ranging from gravitation to fluid dynamics, and have been used in mathematics to solve problems such as the Poincaré conjecture and the Calabi conjecture. They are difficult to study: there are almost no general techniques that work for all such equations, and usually each individual equation has to be studied as a separate

The Navier–Stokes equations are nonlinear partial differential equations in the general case and so remain in almost every real situation. [18] [19] In some cases, such as one-dimensional flow and Stokes flow (or creeping flow), the equations can be simplified to linear equations.

Navier–Stokes equations - Wikipedia

If $k > 1$ one speaks, as a rule, of a vectorial non-linear partial differential equation or of a system of non-linear partial differential equations. The order of (1) is defined as the highest order of a derivative occurring in the equation. One of the best known non-linear equations is the Monge–Ampère equation.

Some partial differential equations can be solved exactly in the Wolfram Language using `DSolve[eqn, y, x1, x2]`, and numerically using `NDSolve[eqns, y, x, xmin, xmax, t, tmin, tmax]`. In general, partial differential equations are much more difficult to solve analytically than are ordinary differential equations. They may sometimes be solved using a Bäcklund transformation, characteristics ...

In case of partial differential equations, most of the equations have no general solution. Therefore, each equation has to be treated independently. Navier-Stokes equation and Euler's equation in fluid dynamics, Einstein's field equations of general relativity are well known nonlinear partial differential equations.

Numerical Methods for Nonlinear Partial Differential Equations

For instance, the nonlinear operator $h_n + \tau N_x \phi(h_n) = h_n + \tau (\phi(h_n) - \phi(h_{n-1})) - \tau^2 h_x h_{xx}$, involved in the Burgers' equation can be approximated by the linear operator $L_x \phi(h_n) = h_n + \tau (\phi(h_n) - \phi(h_{n-1})) - \tau^2 h_x h_{xx}$, where $h_n = h(x, t_n)$ is the state of the system at the previous time $t_n = 1, 2, 3, \dots$.
