Reconstructive Urethral Surgery. This information is useful for children, adults, and older adults. The urethra is the long tube that carries urine outside the body. Because men have a much longer urethra than women, it is more common for men to experience urethral damage requiring surgery. The Yale Medicine Department of Urology offers innovative surgical treatments for men in need of urethral reconstruction, or surgical repair and rerouting of the urinary tract.

Urethral reconstructive surgery, or urethroplasty, is the only "definitive" treatment option for urethral strictures. It is usually reserved for strictures that are severe or non-responsive to endoscopic management. Few Urologists perform these procedures as training in them is hard to come by. Dr. Rapoport is one of a handful of urologists in Canada with fellowship (subspecialty) training in urethral reconstruction.

Urethral stricture disease is much more common in men than in women. In fact, urethral stricture is rare in women. Congenital urethral strictures (present at birth) are rare. Any inflammation of the urethra resulting from injury, trauma, previous surgery, or infection can cause urethral stricture.

~~Urethral Stricture Treatment, Symptoms & Surgery Recovery~~

Urethroplasty is a surgery where the urethra is reconstructed to cure problems like urethral strictures. The types of surgeries are varied and depend upon the location, cause, and length of the stricture. Most surgeries take between three to six hours to complete. An incision is made over the area of the stricture in the penis, scrotum, or perineum (the area between the scrotum and the anus).
