Running: Biomechanics and Exercise Physiology in Practice ...

Energy cost of running (C_r) linearly increases with positive slope but C_r of DR decreases until a minimum slope is reached at -20 %, after which C_r increases again. The effects of slope on biomechanics, muscle contraction patterns and physiological responses have important implications for injury prevention and success of athletes engaged in graded running competitions.

Background: Previous studies have shown that changing acutely from shod to barefoot running induces several changes to running biomechanics, such as altered ankle kinematics, reduced ground-reaction forces, and reduced loading rates. However, uncertainty exists whether these effects still exist after a short period of barefoot running habituation.
