Relief of pain and resolution of lameness after local anesthetic solution is administered into the fascia surrounding a nerve in the distal portion of the limb usually occurs within 5 min, but anesthesia of larger nerves in the proximal portion of the limb may take 20–40 min. Results of a regional nerve block can be misinterpreted if the horse's gait is assessed before the onset of pain relief.

Originating from the proximal aspect of the third metatarsal (cannon) and distal tarsal bones, the SL of the pelvic limb is relatively thinner and longer than that of the thoracic limb. It lies within the metatarsal groove deep to the DDFT.

~~Tendons—Horse Anatomy—WikiVet English~~

During limb evolution, the development of the distal autopod components occurs later than the more proximal stylopod and zeugopod segments . Interestingly, the distal limb elements have a greater degree of morphological and structural variation than the more proximal counterparts, possibly due to their more recent evolution [28,29]. Correspondingly, we find that the horse distal limb elements are variable throughout equid evolution, whereas the proximal segments of the limb are more ...
